Setup for Mac OS 10.3 & 10.4

Note the small print: Every computer is different. These instructions were designed for standard Mac OS X installs of Panther and Tiger (OS 10.3 and 10.4). Some Powerbooks and iBooks might have different options when setting up wireless connections due to OS and software update versions. If you find you cannot connect with these instructions, make sure you are using the most current version of the OS and have run Software Updates (located in your System Preferences).

1. **Open Internet Connect.** You can do this by clicking on the Airport icon in the upper right menu or by opening the Internet Connect application your System/Applications folder.

2. Click on the File pull-down menu and select **New 802.1X Connection.**

   If you don’t see this option, it could be you already have an 802.1X connection activated...which means you can move on to step #3.

3. You should now see a 802.1X icon in your Internet Connect window as shown here. **Click on this icon** to setup your 802.1X wireless connection.

4. Click on the Configuration pull-down menu and choose “Edit Configurations…”

5. Type **EmoryUnplugged** in the Description box.

   Make sure the Network Port is set to **Airport.**

   Type in your **Emory NetId** and password.

   Click on the blue arrow to see the list of wireless networks. Choose **EmoryUnplugged.**

   Uncheck all authentication protocols except **PEAP.**

   Your settings should look like the screen shown at right.

   Click **OK** to close the Configuration window.

   Click Connect.
A Verify Certificate window should soon pop up on your screen (this can sometimes take a minute or two and can look different depending on whether you are using OS X 10.3 or 10.4). Click Show Certificate...

Check the box to “Always trust these certificates”

Click on the arrow next to the Trust Settings options and also select Always Trust from the pull-down menus.

Click Continue

You should now be connected to EmoryUnplugged.

One final step is needed to insure you connect to EmoryUnplugged automatically in the future.

Go back to your System Preferences panel (you can do this quickly by clicking on the blue apple in the upper left of your screen and selecting “System Preferences”).

Click on the “Network” icon.

Choose “Airport” from the Show menu.

Choose “Preferred Networks” from the “By default, join:” options list.

Make sure EmoryUnplugged is listed in your network list. If it is not, click the plus icon to add it as a preferred network.

If EmoryU is also listed, highlight it in the list and click the minus icon to delete it. This will insure EmoryUnplugged is your primary wireless connection on campus.

Click Options

Select “Ask before joining an open network”.

Make sure you do not have “Automatically add new networks to the preferred networks list” selected.

Click OK, then click Apply Now.

You’re Finished!

In the future, when you are in range of an EmoryUnplugged access point, simply choose EmoryUnplugged from your list of wireless networks and you’re connected!
