Note the small print: Every computer is different. These instructions assume you are using Windows XP-SP2’s built in Wireless Zero Configuration Service to control your wireless card. If you are using a different version of the Windows operating system or another software package to manage your wireless card, you may need to reference the instructions that came with your card for information on how to associate your specific wireless card with the EmoryUnplugged wireless access points.

Before you begin: Make sure the date and time on your laptop is correct.

Go to your Control Panel and double-click on Network Connections.

1. Right-click on Wireless Network Connection and select Properties. Your Wireless Network Connection must be enabled to continue. If it is disabled, right-click and select “enable” to continue.

2. Make sure the “Show icon notification” box at the bottom of the screen is checked, then select the Wireless Networks Tab.

3. Check the box labeled Use Windows to configure my wireless network settings.

4. Under Preferred Networks, click Add.

5. In the Wireless Network properties window, type in the network name EmoryUnplugged (case sensitive).
   - Choose WPA for Network Authentication.
   - Choose AES or TKIP for Data encryption.

   - Make sure “Authenticate as computer when computer information if available” is checked.
   - Make sure “Authenticate as guest when user or computer information is unavailable” is unchecked.
   - For EAP type, choose Protected EAP (PEAP).

Then click on Properties.
The Protected EAP Properties window should look like the one shown at right.

- Make sure “Validate server certificate” is checked.
- Make sure “Enable Fast Reconnect” is checked.

Click Configure.

Uncheck the box “Automatically use my Windows logon name and password” and click OK.

Click OK two more times to close both the Protected EAP Properties window and the EmoryUnplugged properties windows.

In the Wireless Network Connections Properties window, you should now see the EmoryUnplugged profile.

Click Advance to see the screen at left.

Then make sure “Access point (infrastructure) networks only” is selected and that you DO NOT have “Automatically connect to non-preferred networks” selected.

Click “Close” Then Click OK.

Now, in the lower right corner of your screen a popup window should appear like the one shown here.

Click on the popup window to authenticate to the network.

Enter your Emory NetId and password in the credentials box.

Type EMORYUNIVAD for the logon domain.

Click OK.

Another popup window will now appear in the lower right task bar that says “Click here to process your logon information for the network EmoryUnplugged”. Click on the popup to see the Validate Server Certificate window shown here. Then click OK.

You’re done! Now when you are within range of an EmoryUnplugged access point, you should connect automatically. No more configuration is needed.
